1) Review of Cations, Anions and Molecules

| CATIONS | ANIONS | MOLECULES |  |  |
| :--- | :--- | :--- | :--- | :--- |
| ammonium | $\mathrm{NH}_{4}{ }^{+}$ | bromide | $\mathrm{Br}^{-}$ | ammonia $\quad \mathrm{NH}_{3}$ |
| aluminium | $\mathrm{Al}^{3+}$ | carbonate | $\mathrm{CO}_{3}{ }^{2-}$ | carbon dioxide $\mathrm{CO}_{2}$ |
| barium | $\mathrm{Ba}^{2+}$ | chloride | $\mathrm{Cl}^{-}$ | water $\quad \mathrm{H}_{2} \mathrm{O}$ |
| calcium | $\mathrm{Ca}^{2+}$ | fluoride | $\mathrm{F}^{-}$ |  |
| hydrogen | $\mathrm{H}^{+}$ | hydroxide | $\mathrm{OH}^{-}$ |  |
| lithium | $\mathrm{Li}^{+}$ | iodide | $5^{-}$ |  |
| magnesium | $\mathrm{Mg}^{2+}$ | nitrate | $\mathrm{NO}_{3}^{-}$ |  |
| potassium | $\mathrm{K}^{+}$ | oxide | $\mathrm{O}^{2-}$ |  |
| sodium <br> strontium | $\mathrm{Na}^{+}$ | $\mathrm{Sr}^{2+}$ | sulfate | $\mathrm{SO}_{4}{ }^{2-}$ |

2) Formulae of Ionic Compounds

| Name | Formula | Name | Formula |
| :--- | :--- | :--- | :--- |
| sodium oxide | $\mathrm{Na}_{2} \mathrm{O}$ | hydrogen chloride | HCl |
| calcium hydroxide | $\mathrm{Ca}(\mathrm{OH})_{2}$ | rubidium hydroxide | RbOH |
| ammonium nitrate | $\mathrm{NH}_{4} \mathrm{NO}_{3}$ |  | magnesium carbonate |
| pgCO | MgCO |  |  |

3) Definitions of acids, bases and salts

## (i) Acids

$\mathrm{Eg} \quad \mathrm{HCl}(\mathrm{g}) \rightarrow \mathrm{H}^{+}(\mathrm{aq})+\mathrm{Cl}^{( }(\mathrm{aq})$
A mixture of HCl and water contains $\mathrm{H}^{+}$ions and is known as hydrochloric acid
$\mathrm{Eg} \quad \mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{I}) \rightarrow 2 \mathrm{H}^{+}(\mathrm{aq})+\mathrm{SO}_{4}{ }^{2-}(\mathrm{aq})$
A mixture of $\mathrm{H}_{2} \mathrm{SO}_{4}$ and water contains $\mathrm{H}^{+}$ions and is known as sulfuric acid
$\mathrm{Eg} \quad \mathrm{HNO}_{3}(\mathrm{I}) \rightarrow \mathrm{H}^{+}(\mathrm{aq})+\mathrm{NO}_{3}^{-}(\mathrm{aq})$
A mixture of $\mathrm{HNO}_{3}$ and water contains $\mathrm{H}^{+}$ions and is known as nitric acid
$\mathrm{H}^{+}$ions can also be referred to as protons.
Acids can therefore be described as proton donors.

## (ii) bases and alkalis

Bases can therefore be described as proton acceptors.
Hydroxide ions can accept $\mathrm{H}^{+}$ions to form $\mathrm{H}_{2} \mathrm{O}: \mathrm{H}^{+}+\mathrm{OH}^{-} \rightarrow \mathrm{H}_{2} \mathrm{O}$
Oxide ions can accept $\mathrm{H}^{+}$ions to form $\mathrm{H}_{2} \mathrm{O}: 2 \mathrm{H}^{+}+\mathrm{O}^{2-} \rightarrow \mathrm{H}_{2} \mathrm{O}$
Carbonate ions can accept $\mathrm{H}^{+}$ions to form $\mathrm{CO}_{2}$ and $\mathrm{H}_{2} \mathrm{O}: 2 \mathrm{H}^{+}+\mathrm{CO}_{3}{ }^{2-} \rightarrow \mathrm{CO}_{2}+\mathrm{H}_{2} \mathrm{O}$
Ammonia can accept $\mathrm{H}^{+}$ions to form $\mathrm{NH}_{4}{ }^{+}$ions: $\mathrm{NH}_{3}+\mathrm{H}^{+} \rightarrow \mathrm{NH}_{4}{ }^{+}$

A substance which dissolves in water to give a solution containing $\mathrm{OH}^{-}$ions is called an alkali. An alkali is therefore a soluble base.
4) Classifying substances as acids, bases and salts

| ACIDS | BASES | SALTS |
| :--- | :--- | :--- |
| $\mathrm{HNO}_{3}$ | $\mathrm{Na}_{2} \mathrm{O}$ | $\mathrm{NH}_{4} \mathrm{NO}_{3}$ |
| HCl | $\mathrm{Ca}(\mathrm{OH})_{2}$ | $\mathrm{SrSO}_{4}$ |
| $\mathrm{H}_{2} \mathrm{SO}_{4}$ | $\mathrm{~K}_{2} \mathrm{CO}_{3}$ | $\left(\mathrm{NH}_{4}\right)_{2} \mathrm{SO}_{4}$ |
|  | MgO | $\mathrm{K}_{2} \mathrm{SO}_{4}$ |
|  | MgCO | $\mathrm{Ca}\left(\mathrm{NO}_{3}\right)_{2}$ |
|  | RbOH | NH |
|  |  | CsBr |
|  |  | BaSO |
|  |  | $\mathrm{Sr}\left(\mathrm{NO}_{3}\right)_{2}$ |
|  |  |  |

## 5) Neutralization Reactions

Acid + metal hydroxide $\rightarrow$ metal salt + water
Eg hydrochloric acid + sodium hydroxide $\rightarrow$ sodium chloride + water
Symbol equation: $\mathrm{HCl}+\mathrm{NaOH} \rightarrow \mathrm{NaCl}+\mathrm{H}_{2} \mathrm{O}$
Acid + metal oxide $\rightarrow$ metal salt + water
Eg nitric acid + calcium oxide $\rightarrow$ calcium nitrate + water
Symbol equation: $2 \mathrm{HNO}_{3}+\mathrm{CaO} \rightarrow \mathrm{Ca}\left(\mathrm{NO}_{3}\right)_{2}+\mathrm{H}_{2} \mathrm{O}$

Acid + metal carbonate $\rightarrow$ metal salt + carbon dioxide + water
Eg sulphuric acid + potassium carbonate $\rightarrow$ potassium sulphate + carbon dioxide + water
Symbol equation: $\mathrm{H}_{2} \mathrm{SO}_{4}+\mathrm{K}_{2} \mathrm{CO}_{3} \rightarrow \mathrm{~K}_{2} \mathrm{SO}_{4}+\mathrm{CO}_{2}+\mathrm{H}_{2} \mathrm{O}$

Acid + ammonia $\rightarrow$ ammonium salt
Eg hydrochloric acid + ammonia $\rightarrow$ ammonium chloride
Symbol equation: $\mathrm{HCl}+\mathrm{NH}_{3} \rightarrow \mathrm{NH}_{4} \mathrm{Cl}$
a) Nitric acid with potassium hydroxide solution

Equation: $\mathrm{HNO}_{3}(\mathrm{aq})+\mathrm{KOH}(\mathrm{aq}) \rightarrow \mathrm{KNO}_{3}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{I})$ Name of salt: potassium nitrate
b) Sulfuric acid with sodium hydroxide solution

Equation: $\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq})+2 \mathrm{NaOH}(\mathrm{aq}) \rightarrow \mathrm{K}_{2} \mathrm{SO}_{4}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{I})$ Name of salt: potassium sulfate
c) Hydrochloric acid with calcium hydroxide powder

Equation: $2 \mathrm{HCl}(\mathrm{aq})+\mathrm{Ca}(\mathrm{OH})_{2}(\mathrm{~s}) \rightarrow \mathrm{CaCl}_{2}(\mathrm{aq})+2 \mathrm{H}_{2} \mathrm{O}(\mathrm{I})$
Name of salt: calcium chloride
d) Nitric acid with calcium oxide powder

Equation: $2 \mathrm{HNO}_{3}(\mathrm{aq})+\mathrm{CaO}(\mathrm{s}) \rightarrow \mathrm{Ca}\left(\mathrm{NO}_{3}\right)_{2}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{I})$
Name of salt: calcium nitrate
e) Hydrochloric acid with barium oxide powder

Equation: $2 \mathrm{HCl}(\mathrm{aq})+\mathrm{BaO}(\mathrm{s}) \rightarrow \mathrm{BaCl}_{2}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{I})$
Name of salt: barium chloride
f) Sulfuric acid with magnesium oxide powder

Equation: $\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq})+\mathrm{BaO}(\mathrm{s}) \rightarrow \mathrm{MgSO}_{4}(\mathrm{aq})+\mathrm{H}_{2} \mathrm{O}(\mathrm{I})$
Name of salt: magnesium sulfate
g) Nitric acid with calcium carbonate powder

Equation: $2 \mathrm{HNO}_{3}(\mathrm{aq})+\mathrm{CaCO}_{3}(\mathrm{~s}) \rightarrow \mathrm{Ca}\left(\mathrm{NO}_{3}\right)_{2}(\mathrm{aq})+\mathrm{CO}_{2}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{O}(\mathrm{I})$
Name of salt: calcium nitrate
h) Hydrochloric acid with barium carbonate powder

Equation: $2 \mathrm{HCl}(\mathrm{aq})+\mathrm{BaCO}_{3}(\mathrm{~s}) \rightarrow \mathrm{BaCl}_{2}(\mathrm{aq})+\mathrm{CO}_{2}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{O}(\mathrm{I})$
Name of salt: barium chloride
i) Sulphuric acid with sodium carbonate solution

Equation: $\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq})+\mathrm{Na}_{2} \mathrm{CO}_{3}(\mathrm{aq}) \rightarrow \mathrm{Na}_{2} \mathrm{SO}_{4}(\mathrm{aq})+\mathrm{CO}_{2}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{O}(\mathrm{I})$
Name of salt: sodium sulfate
j) Nitric acid with ammonia solution

Equation: $\mathrm{HNO}_{3}(\mathrm{aq})+\mathrm{NH}_{3}(\mathrm{aq}) \rightarrow \mathrm{NH}_{4} \mathrm{NO}_{3}(\mathrm{aq})$
Name of salt: ammonium nitrate
k) Sulfuric acid with ammonia solution

Equation: $\mathrm{H}_{2} \mathrm{SO}_{4}(\mathrm{aq})+2 \mathrm{NH}_{3}(\mathrm{aq}) \rightarrow\left(\mathrm{NH}_{4}\right)_{2} \mathrm{SO}_{4}(\mathrm{aq})$
Name of salt: ammonium sulfate
I) Hydrochloric acid with ammonia solution

Equation: $\mathrm{HCl}(\mathrm{aq})+\mathrm{NH}_{3}(\mathrm{aq}) \rightarrow \mathrm{NH}_{4} \mathrm{Cl}(\mathrm{aq})$
Name of salt: ammonium chloride

## OBSERVING NEUTRALISATION REACTIONS

When an acid reacts with a solid metal hydroxide or oxide, the solid dissolves.
When an acid reacts with a solid metal carbonate, the solid dissolves and effervescence will also be observed.
When an acid reacts with an aqueous metal carbonate, effervescence will be observed

### 5.2 HONORS CLASS WORKSHEET - ACIDITY, ALKALINITY AND THE PH SCALE

## 1) Acidity and Alkalinity

The ion which makes solutions acidic is $\mathrm{H}^{+}$
The ion which makes solutions alkaline is $\mathrm{OH}^{-}$
Water dissociates very slightly to produce $\mathrm{H}^{+}$and $\mathrm{OH}^{-}$ions. Equation: $\mathrm{H}_{2} \mathrm{O} \rightleftarrows \mathrm{H}^{+}+\mathrm{OH}^{-}$ In pure water, the concentration of $\mathrm{H}^{+}$and $\mathrm{OH}^{-}$is around $1 \times 10^{-7} \mathrm{~mol} / \mathrm{L}$
Any solution which contains equal concentrations of $\mathrm{H}^{+}$and $\mathrm{OH}^{-}$ions is said to be neutral In solutions which contain acids, how will the concentrations of $\mathrm{H}^{+}$and OH - compare to those in pure water, and therefore to each other?
$\left[\mathrm{H}^{+}\right]>1 \times 10^{-7} \mathrm{~mol} / \mathrm{L},\left[\mathrm{OH}^{-}\right]<1 \times 10^{-7} \mathrm{~mol} / \mathrm{L},\left[\mathrm{H}^{+}\right]>\left[\mathrm{OH}^{-}\right]$
In solutions which contain alkalis, how will the concentrations of $\mathrm{H}^{+}$and OH - compare to those in pure water, and therefore to each other?
$\left[\mathrm{H}^{+}\right]<1 \times 10^{-7} \mathrm{~mol} / \mathrm{L},\left[\mathrm{OH}^{-}\right]>1 \times 10^{-7} \mathrm{~mol} / \mathrm{L},\left[\mathrm{H}^{+}\right]<\left[\mathrm{OH}^{-}\right]$

| Concentration of $\mathrm{H}^{+}$ions <br> $(\mathrm{mol} / \mathrm{L})$ | Concentration of $\mathrm{OH}^{-}$ions <br> $(\mathrm{mol} / \mathrm{L})$ | Type of solution |
| :---: | :---: | :--- |
| $0.1\left(1 \times 10^{-1}\right)$ | $1 \times 10^{-13}$ | acidic |
| $0.001\left(1 \times 10^{-3}\right)$ | $1 \times 10^{-11}$ | acidic |
| $1 \times 10^{-5}$ | $1 \times 10^{-9}$ | acidic |
| $1 \times 10^{-7}$ | $1 \times 10^{-7}$ | neutral |
| $1 \times 10^{-9}$ | $1 \times 10^{-5}$ | alkaline |
| $1 \times 10^{-11}$ | $1 \times 10^{-3}(0.001)$ | alkaline |
| $1 \times 10^{-13}$ | $1 \times 10^{-1}(0.1)$ | alkaline |

## 2) The pH scale

The pH of a solution is defined as the negative logarithm of the hydrogen ion concentration ( pH stands for power of hydrogen)
pH is a logarithmic scale. What does this mean? An change by a factor of 10 in the quantity causes a change of 1 unit in the scale

- if the $\mathrm{H}^{+}$concentration is 0.1 (ie $1 \times 10^{-1}$ ) $\mathrm{mol} / \mathrm{L}$, the pH of the solution is 1
- if the $\mathrm{H}^{+}$concentration is 0.001 (ie $1 \times 10^{-3}$ ) $\mathrm{mol} / \mathrm{L}$, the pH of the solution is 3
- if the $\mathrm{H}^{+}$concentration is $1 \times 10^{-7} \mathrm{~mol} / \mathrm{L}$, the pH of the solution is 7
- if the $\mathrm{H}^{+}$concentration is $1 \times 10^{-11} \mathrm{~mol} / \mathrm{L}$, the pH of the solution is 11
- if the $\mathrm{H}^{+}$concentration is $1 \times 10^{-13} \mathrm{~mol} / \mathrm{L}$, the pH of the solution is 13

What does a low pH tell you about the solution? acidic
What does a high pH tell you about the solution? alkaline

The relationship between pH , acidity and alkalinity is summarised in the table below:

| pH | -1 | 1 | 3 | 5 | 7 | 9 | 11 | 13 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Acidity | strongly acidic | weakly acidic | neutral | weakly <br> alkaline | strongly <br> alkaline |  |  |  |
| $\left[\mathrm{H}^{+}\right]$ | very high | quite high | medium | quite low | very low |  |  |  |
| $\left[\mathrm{OH}^{-}\right]$ | very low | quite low | medium | quite high | very high |  |  |  |

Examples of the pH of common solutions are:

| solution | pH | Solution | pH | solution | pH |
| :--- | :--- | :--- | :--- | :--- | :--- |
| $1 \mathrm{~mol} / \mathrm{L} \mathrm{HCl}$ | 0 | lemon juice | $2 / 3$ | vinegar | 3 |
| orange juice | $3 / 4$ | pure water | 7 | household bleach | 13 |
| $1 \mathrm{~mol} / \mathrm{L} \mathrm{NaOH}$ | 14 |  |  |  |  |

### 5.3 HONORS CLASS WORKSHEET - STRONG AND WEAK ACIDS

## 1) strong and weak acids

Strong Acid: fully dissociates into $\mathrm{H}^{+}$ions in water
Example: $\mathrm{HCl} \quad$ Equation: $\mathrm{HCl} \rightarrow \mathrm{H}^{+}+\mathrm{Cl}^{-}$
Weak Acid: slightly dissociates into $\mathrm{H}^{+}$ions in water
Example: acetic acid $-\mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2} \quad$ Equation: $\mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2} \rightleftarrows \mathrm{H}^{+}+\mathrm{C}_{2} \mathrm{H}_{3} \mathrm{O}_{2}^{-}$

## 2) strong and weak bases

Strong Base: fully dissociates into $\mathrm{OH}^{-}$ions in water
Example: $\mathrm{NaOH} \quad$ Equation: $\mathrm{NaOH} \rightarrow \mathrm{Na}^{+}+\mathrm{OH}^{-}$
Weak Base: slightly dissociates into $\mathrm{OH}^{-}$ions in water
Example: $\mathrm{NH}_{3} \quad$ Equation: $\mathrm{NH}_{3}+\mathrm{H}_{2} \mathrm{O} \rightleftarrows \mathrm{NH}_{4}^{+}+\mathrm{OH}^{-}$
Example $\mathrm{CO}_{3}{ }^{2-} \quad$ Equation: $\mathrm{CO}_{3}{ }^{2-}+\mathrm{H}_{2} \mathrm{O} \rightleftarrows \mathrm{HCO}_{3}^{-}+\mathrm{OH}^{-}$
$\mathrm{Eg} \mathrm{Ca}(\mathrm{OH})_{2} \quad$ Equation: $\mathrm{Ca}(\mathrm{OH})_{2} \rightleftarrows \mathrm{Ca}^{2+}+2 \mathrm{OH}^{-}$

## 3) Neutralizing strong and weak acids

0.01 moles of a strong acid $(\mathrm{HCl})$ will require 0.01 moles of $\mathrm{OH}^{-}$to neutralise it
0.01 moles of a weak acid $\left(\mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}\right)$ will require 0.01 moles of $\mathrm{OH}^{-}$to neutralise it

Reason: Equation 1: $\mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2} \rightleftarrows \mathrm{H}^{+}+\mathrm{C}_{2} \mathrm{H}_{3} \mathrm{O}_{2}^{-}$
Equation 2: $\mathrm{H}^{+}+\mathrm{OH}^{-} \rightarrow \mathrm{H}_{2} \mathrm{O}$
As the $\mathrm{H}^{+}$ions react with the $\mathrm{OH}^{-}$, the weak acid dissociates more to replace them; this continues until the weak acid is fully dissociate

## 4) Differences between strong and weak acids (and bases)

(i) Enthalpy of neutralization

Equation for neutralization of $\mathrm{HCl} / \mathrm{HNO}_{3}: \quad \mathrm{H}^{+}+\mathrm{OH}^{-} \rightarrow \mathrm{H}_{2} \mathrm{O} \quad \Delta \mathrm{H}=-57 \mathrm{~kJ} / \mathrm{mol}$ Equation for neutralization of $\mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}$ :

1. $\mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2} \rightleftarrows \mathrm{H}^{+}+\mathrm{C}_{2} \mathrm{H}_{3} \mathrm{O}_{2}^{-} \quad \Delta \mathrm{H}=+5 \mathrm{~kJ} / \mathrm{mol}$
2. $\mathrm{H}^{+}+\mathrm{OH}^{-} \rightarrow \mathrm{H}_{2} \mathrm{O}$
$\Delta \mathrm{H}=-57 \mathrm{~kJ} / \mathrm{mol}$
Overall:
$\Delta \mathrm{H}=-52 \mathrm{~kJ} / \mathrm{mol}$
(ii) pH
$0.100 \mathrm{~mol} / \mathrm{L} \mathrm{HCl}$ is $100 \%$ dissociated so $\mathrm{H}^{+}$concentration $=0.100 \mathrm{~mol} / \mathrm{L}$ and $\mathrm{pH}=1$
$0.100 \mathrm{~mol} / \mathrm{L} \mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}$ is $1 \%$ dissociated so $\mathrm{H}^{+}$concentration $=0.001 \mathrm{~mol} / \mathrm{L}$ and $\mathrm{pH}=3$
$0.100 \mathrm{~mol} / \mathrm{L} \mathrm{NaOH}$ is $100 \%$ dissociated so $\mathrm{OH}^{-}$concentration $=0.100 \mathrm{~mol} / \mathrm{L}$ and $\mathrm{pH}=13$
$0.100 \mathrm{~mol} / \mathrm{L} \mathrm{NH}_{3}$ is $1 \%$ dissociated so $\mathrm{OH}^{-}$concentration $=0.001 \mathrm{~mol} / \mathrm{L}$ and $\mathrm{pH}=11$

## (iii) Conductivity

Which solution will have the higher conductivity: $0.1 \mathrm{~mol} / \mathrm{L} \mathrm{HCl}$ or $0.1 \mathrm{~mol} / \mathrm{L} \mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}$ ? Why? $0.1 \mathrm{~mol} / \mathrm{L} \mathrm{HCl}$ will have a higher conductivity than $0.1 \mathrm{~mol} / \mathrm{L} \mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}$ because the acid is fully dissociated into its ions, so the concentration of ions in solution is much higher

## (iv) Reactivity

(a) $\mathrm{MgO}+2 \mathrm{HCl} \rightarrow \mathrm{MgCl}_{2}+\mathrm{H}_{2} \mathrm{O}$
(b) $\mathrm{MgO}+\mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2} \rightarrow \mathrm{Mg}\left(\mathrm{C}_{2} \mathrm{H}_{3} \mathrm{O}_{2}\right)+\mathrm{H}_{2} \mathrm{O}$

Which reaction will be faster, and why? The reaction between MgO and HCl will be much faster because HCl is a strong acid so has a much higher concentration of $\mathrm{H}^{+}$ions

### 5.4 HONORS CLASS WORKSHEET - ACID-BASE INDICATORS

State and explain which color the indicator will show at high pH
Color 2 as a high pH means a low $\left[\mathrm{H}^{+}\right]$which will push the equilibrium to the right
State and explain which color the indicator will show at low pH
Color 1 as a low pH means a high $\left[\mathrm{H}^{+}\right]$which will push the equilibrium to the left The pH at which the indicator changes color is called the end point of the indicator. It varies from indicator to indicator. It depends on the strength of the acid, which affects its tendency to dissociate

| Indicator | Color 1 | Color 2 | pH at which color <br> changes | color during <br> transitional pH range |
| :--- | :--- | :--- | :--- | :--- |
| methyl orange | pink | yellow | $3.1-4.4$ | orange |
| methyl red | red | yellow | $4.4-6.3$ | orange |
| bromothymol blue | yellow | blue | $6.0-7.7$ | green |
| phenolphthalein | colorless | purple | $8.3-10.0$ | pink/purple |

| pH | methyl orange | methyl red | bromothymol blue | phenolphthalein | Mixture of all <br> indicators |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 2.0 | pink | red | yellow | colorless | red/orange |
| 3.5 | orange | red | yellow | colorless | orange |
| 5.0 | yellow | orange | yellow | colorless | yellow |
| 6.5 | yellow | yellow | green | colorless | turquoise |
| 8.0 | yellow | yellow | blue | colorless | green |
| 9.5 | yellow | yellow | blue | pink | blue |
| 11.0 | yellow | yellow | blue | Purple | blue/purple |

### 5.5 HONORS CLASS WORKSHEET - TITRATIONS

Quantitative Analysis: determination of how much of a substance is present
Volumetric Analysis: determination of how much of a substance is present by measuring volumes
Titration: precise determination of the volume of one liquid required to completely react with a fixed volume of another

Steps involved in carrying out a titration:

- use a pipette to measure out a fixed volume of alkali into a conical flask
- add two drops of indicator to the flask
- fill a burette with acid and record the initial volume of acid in the burette
- allow the acid from the burette to run slowly into the conical flask
- until the indicator changes color
- note the final volume of acid in the burette
- subtract the initial volume from the final volume to determine the volume of acid used
Why should the titration be carried out three times?
- $\quad 2^{\text {nd }}$ result determines whether or not the two results are consistent
- $3^{\text {rd }}$ result states which of the $1^{\text {st }}$ two titrations is more reliable, if the first two are not consistent

The point during a titration at which the acid and the alkali have neutralised each other exactly is called the equivalence point.

| Type of titration | pH change at equivalence point | best indicator |
| :--- | :---: | :--- |
| strong acid - strong base | $3.0-11.0$ | any |
| weak acid - strong base | $7.0-11.0$ | phenolphthalein |
| strong acid - weak base | $3.0-7.0$ | methyl red |

Question: In a titration 28.3 mL of a $0.10 \mathrm{~mol} / \mathrm{L}$ solution of $\mathrm{H}_{2} \mathrm{SO}_{4}$ was required to change the color of the indicator in 25 mL of a solution of NaOH . What was the molarity of the NaOH solution?

| Equation: | $\mathrm{H}_{2} \mathrm{SO}_{4}+2 \mathrm{NaOH} \rightarrow \mathrm{Na}_{2} \mathrm{SO}_{4}+2 \mathrm{H}_{2} \mathrm{O}$ |  |
| :--- | :--- | :--- |
|  | acid | Base |
| volume $(\mathrm{mL})$ | 28.3 | 25 |
| Moles | 0.00283 | 0.00566 |
| molarity $(\mathrm{mol} / \mathrm{L})$ | 0.1 | 0.226 |

(a) 18.4 mL of HCl was required to neutralise 25 mL of $0.1 \mathrm{~mol} / \mathrm{L} \mathrm{NaOH}$. Deduce the molarity of the HCl .

| Equation: | $\mathrm{HCl}+\mathrm{NaOH} \rightarrow \mathrm{NaCl}+\mathrm{H}_{2} \mathrm{O}$ |  |
| :--- | :--- | :--- |
| volume (mL) | acid | Base |
| moles | 18.4 | 25 |
| molarity (mol$/ \mathrm{L})$ | 0.0025 | 0.0025 |

(b) 13.9 mL of acetic acid $\left(\mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}\right)$ was required to neutralise 25 mL of $0.1 \mathrm{~mol} / \mathrm{L} \mathrm{NaOH}$. Deduce the molarity of the $\mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}$.

| Equation: | $\mathrm{HC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}+\mathrm{NaOH} \rightarrow \mathrm{NaC}_{2} \mathrm{H}_{3} \mathrm{O}_{2}+\mathrm{H}_{2} \mathrm{O}$ |  |
| :--- | :--- | :--- |
| volume $(\mathrm{mL})$ | acid | Base |
| moles | 13.9 | 25 |
| molarity $(\mathrm{mol} / \mathrm{L})$ | 0.0025 | 0.0025 |

(c) 25.0 mL of a solution of $\mathrm{Na}_{2} \mathrm{CO}_{3}$ was titrated against $0.1 \mathrm{~mol} / \mathrm{L} \mathrm{HCl}$ and 24.5 mL of the acid were required. Calculate the molarity of the $\mathrm{Na}_{2} \mathrm{CO}_{3}$ solution.

| Equation: | $2 \mathrm{HCl}+\mathrm{Na}_{2} \mathrm{CO}_{3} \rightarrow 2 \mathrm{NaCl}+\mathrm{CO}_{2}+\mathrm{H}_{2} \mathrm{O}$ |  |
| :--- | :--- | :--- |
|  | Acid | Base |
| volume (mL) | 24.5 | 25 |
| Moles | 0.00245 | 0.001225 |
| molarity (mol$/ \mathrm{L})$ | 0.1 | 0.049 |

(d) Sodium carbonate exists in hydrated form, $\mathrm{Na}_{2} \mathrm{CO}_{3} \cdot \mathrm{xH}_{2} \mathrm{O}$, in the solid state. 0.35 g of a sodium carbonate sample was dissolved in water. The resulting solution was titrated against $0.1 \mathrm{~mol} / \mathrm{L} \mathrm{HCl}$ and 24.5 mL of the acid were required. Calculate the value of $x$ given the equation: $\mathrm{Na}_{2} \mathrm{CO}_{3}+2 \mathrm{HCl} \rightarrow 2 \mathrm{NaCl}+\mathrm{CO}_{2}+\mathrm{H}_{2} \mathrm{O}$
moles of $\mathrm{HCl}=24.5 / 1000 \times 0.1=0.00245$
moles of $\mathrm{Na}_{2} \mathrm{CO}_{3}=0.001225$
molar mass of $\mathrm{Na}_{2} \mathrm{CO}_{3} \cdot \mathrm{xH}_{2} \mathrm{O}=0.35 / 0.001225=286$
$\mathrm{Na}_{2} \mathrm{CO}_{3}=106$ so $\mathrm{xH}_{2} \mathrm{O}=18 \mathrm{x}=(286-106)=180$
So $x=180 / 18=10$
(e) Succinic acid $\left(\mathrm{H}_{2} \mathrm{X}\right)$ reacts with dilute sodium hydroxide as follows:
$\mathrm{H}_{2} \mathrm{X}+2 \mathrm{NaOH} \rightarrow \mathrm{Na}_{2} \mathrm{X}+2 \mathrm{H}_{2} \mathrm{O}$
2.00 g of succinic acid were dissolved in water and used to prepare a 250 mL solution. This solution was placed in a burette and 18.4 mL was required to neutralise 25 mL of $0.1 \mathrm{~mol} / \mathrm{L}$ NaOH . Deduce the molar mass of succinic acid.
(i) Calculate the mass concentration of the succinic acid solution $2.00 /(250 / 1000)=8.00 \mathrm{~g} / \mathrm{L}$
(ii) Use the titration result to deduce the molarity of the succinic acid solution

Moles of $\mathrm{NaOH}=25 / 1000 \times 0.1=0.0025$, so moles of $\mathrm{H}_{2} \mathrm{X}=000125$
Volume of $\mathrm{H}_{2} \mathrm{X}=18.4 \mathrm{~mL}=0.0184 \mathrm{~mL}$, so molarity $=0.00125 / 0.0184=0.0679 \mathrm{~mol} / \mathrm{L}$
(iii) Hence calculate the molar mass of succinic acid

Molar mass $=$ mass concentration $/$ molarity $=8.00 / 0.0679=118 \mathrm{~g} / \mathrm{mol}$
(f) Oxalic acid $\left(\mathrm{H}_{2} \mathrm{C}_{2} \mathrm{O}_{4} \cdot \mathrm{xH}_{2} \mathrm{O}\right)$ reacts with NaOH in a 1:2 ratio. 1.85 g of oxalic acid was dissolved in water and used to prepare 250 mL of oxalic solution. This solution was placed in a burette and 21.3 mL were required to neutralise 25 mL of $0.1 \mathrm{~mol} / \mathrm{L} \mathrm{NaOH}$.
(i) Calculate the mass concentration of the oxalic acid solution
$1.85 /(250 / 1000)=7.40 \mathrm{~g} / \mathrm{L}$
(ii) Use the titration result to deduce the molarity of the oxalic acid solution

Moles of $\mathrm{NaOH}=25 / 1000 \times 0.1=0.0025$, so moles of $\mathrm{H}_{2} \mathrm{C}_{2} \mathrm{O}_{4} \cdot \mathrm{xH}_{2} \mathrm{O}=000125$
Volume of $\mathrm{H}_{2} \mathrm{X}=21.3 \mathrm{~mL}=0.0213 \mathrm{~mL}$, so molarity $=0.00125 / 0.0213=0.0586 \mathrm{~mol} / \mathrm{L}$
(iii) Hence calculate the molar mass of oxalic acid

Molar mass $=$ mass concentration $/$ molarity $=7.40 / 0.0586=126 \mathrm{~g} / \mathrm{mol}$
(iv) Hence calculate the value of $x$
$\mathrm{H}_{2} \mathrm{C}_{2} \mathrm{O}_{4}=90$, so $90+18 x=126$, so $18 x=36$, so $x=36 / 18=2$
